A4.2 - Number injured miscellaneous by Youngest casualty.....	7
A5.1 - List table .....	8
A5.2 - Info Bar Text.....	8
A5.3 - Cluster Diagram.....	8

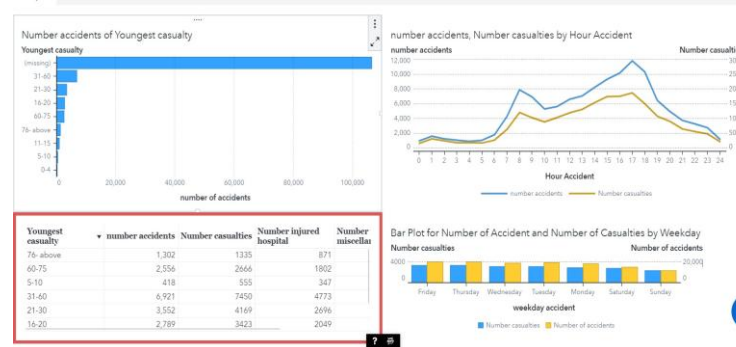

## Execute Summary

Bar graph shows the age group in which hospital admissions are most common. Based on the graph, I discovered that a greater number of accident victims, aged 31 to 60, are receiving medical attention in hospitals. Although the image takes up the entire view of the page, I like the dual axis bar plot and list table with bar plot since they allow the chart to change as we click on an age group.

The most striking thing I noticed from the graph is how few persons with lost

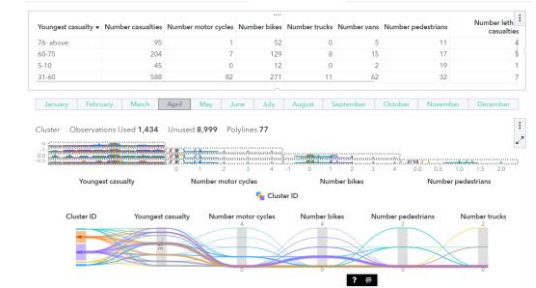

focuses obnoxiously on the quantity of fatalities. On this page, a pie chart, a bar graph, and a table are all linked graphs that show the total number of fatalities again grouped by age. As the graph and table show, the age range of 31 to 60 has a higher frequency of fatalities.

you will find a dual axis bar plot, a list table, and a dual axis line chart. In essence, I choose who were the victims. There are more missing persons that are visible on the bar plot. Out of the 106299 total accidents, 56 victims are reported missing and are visible when the bar plot is viewed. Actually, the table I've used can display any data. Additionally, a dual-axis line chart displays the quantity of casualties and accidents over time. I discovered that there are more number accidents and missing numbers in the dataset

The total number of miscellaneous injuries is displayed in a targeted bar on page 4. This graph makes it simple to understand the overall number of victims of miscellaneous injuries. As additional pages in my report, I've included a table and a treemap in addition to the graph. All of these are connected to one another. This part of the report makes it easy to understand

Using a cluster graph to display numerous variables in a single graph, the final page of my report illustrates how people are getting into accidents, whether they are caused by cars, vans, or other vehicles. This sas report makes it clear which set of people is being harmed more and by what. It appears that this will significantly lower the amount of accidents.

## Summary

Number accidents of Youngest casualty

Youngest casualty

number accidents, Number casualties by Hour Accident

number accidents

Number casualties

b A1.1

Youngest casualty ▼ number accidents Number casualties

	106,299	56
--	---------	----
